

# TALES FROM A UNIVERSE NINJA: PART ONE

David G. Rathbun, Integra Solutions

# BREAKOUT INFORMATION

---

- ▶ Tales from a Universe Ninja, Part One
  - ▶ Training classes and product manuals can take you only so far. What do you do when the manual stops, but the project requirements do not? In this two-part session, find out how a team of experienced universe designers solved real-world universe challenges. Get tips, many of which are applicable to versions prior to BusinessObjects XI Release 2. Part one focuses primarily on the Designer application. See creative uses of standard Designer features, new wrinkles on some standard solutions, and in-depth coverage of specific universe parameters. Download sample files after the session. Add to your arsenal of universe practices, and be at peace with the universe.

Print Information (please leave for Business Objects use)

Print Code

# AGENDA

1. Introduction
2. In depth index awareness
3. Leveraging shortcut joins
4. Using JOIN\_BY\_SQL
5. Conclusion
6. Q&A

# INTRODUCTION

# WHO IS DAVE?

---

- ▶ Dedicated to BusinessObjects solutions since 1995
  - ▶ Consulting / mentoring / troubleshooting
  - ▶ Primary focus on knowledge transfer and client education
- ▶ Selected to present at 1996 - 2007 user conference
  - ▶ 12 consecutive years as a presenter
- ▶ Charter member of BOB
  - ▶ <http://busobj.forumtopics.com>
- ▶ I Blog! Dave's Adventures in Business Objects
  - ▶ <http://www.dagira.com>

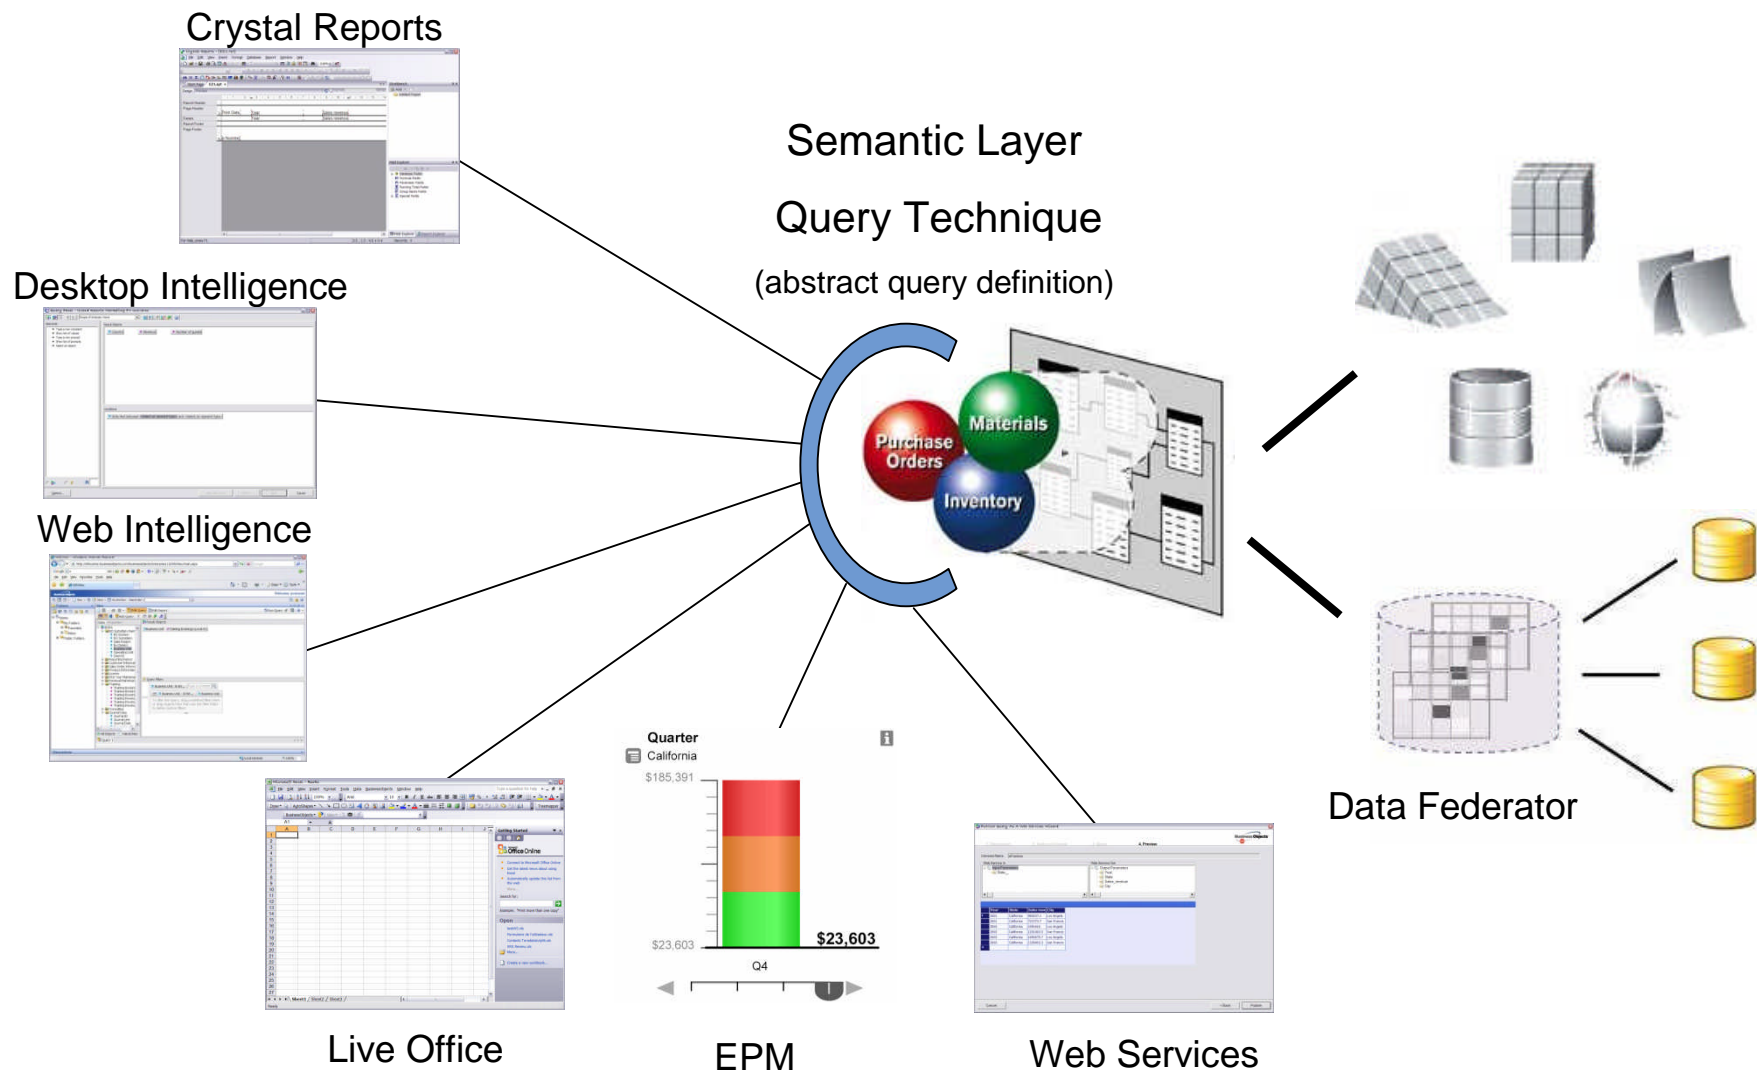

# WHAT IS UNIVERSE DESIGNER?

- ▶ Provides a business representation of corporate data for end users
- ▶ They can access data autonomously using their everyday vocabulary
- ▶ Allows IT to keep control of the data access with fine-grained security

# WHERE CAN YOU USE UNIVERSE DESIGNER?

# DEMONSTRATIONS TODAY

---

- ▶ Demonstration universes
  - ▶ Island Resorts Marketing
  - ▶ eFashion
- ▶ Both demonstration databases were converted to Oracle
  - ▶ Required in order to demonstrate advanced features
  - ▶ JOIN\_BY\_SQL
- ▶ Full software configuration
  - ▶ BusinessObjects Enterprise XI Release 2 Service Pack 2
  - ▶ Microsoft SQL Server is used for the repository
  - ▶ Oracle 10g is used for both databases

# IN DEPTH INDEX AWARENESS

*Strategy without tactics is the slowest route to victory. Tactics without strategy is the noise before defeat.*

– Sun Tzu

# WHAT IS INDEX AWARENESS?

---

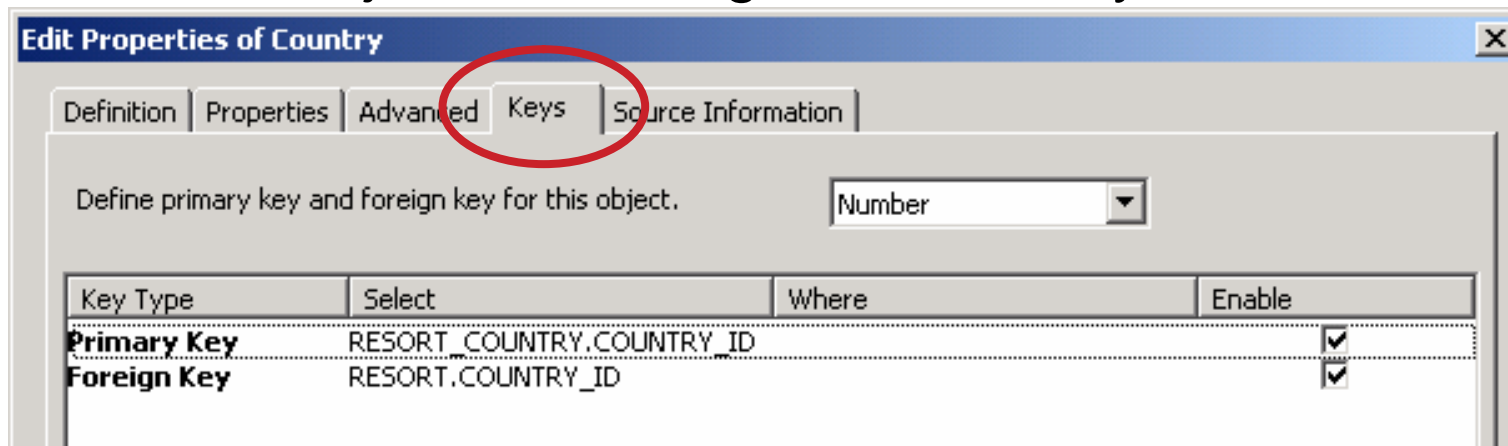

- ▶ What does the Universe Designer help say?

*Object keys allow Universe Designer to generate more efficient SQL by filtering on primary key values and eliminating unnecessary joins.*

- ▶ That's great, but what does it mean?
- ▶ How do I set it up?
- ▶ When does it work?
- ▶ When does it not work?

# SETTING UP INDEX AWARENESS

- ▶ Select an object and navigate to the keys tab

- ▶ Key info is driven by the table relationships

- ▶ Repeat for each object from that table

# USING MULTIPLE KEYS

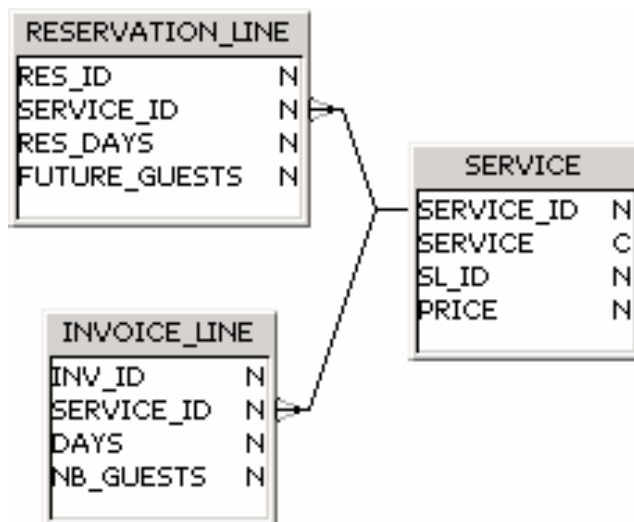

- ▶ Index aware can go in more than one direction

**Edit Properties of Service**

Definition Properties Advanced **Keys** Source Information

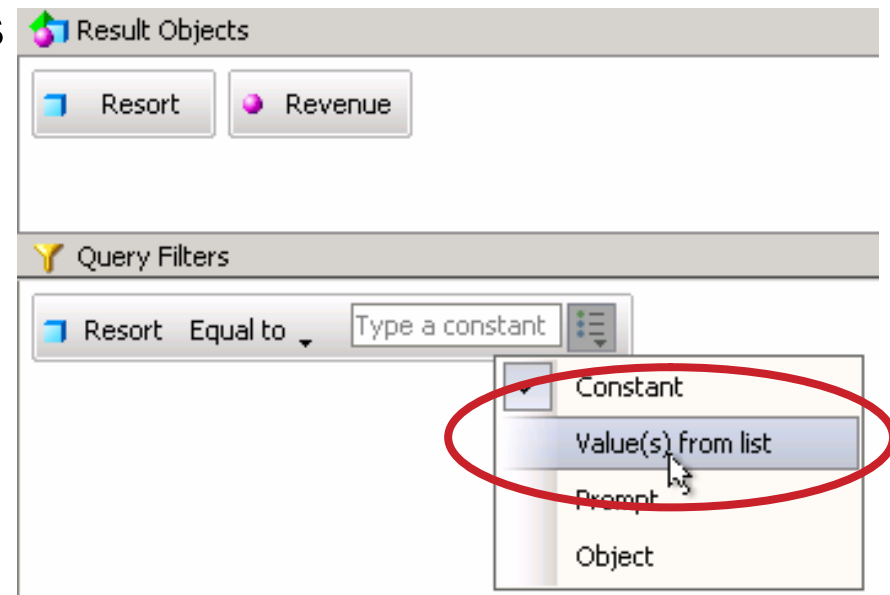

Define primary key and foreign key for this object. Number

| Key Type           | Select                      | Where | Enable                              |
|--------------------|-----------------------------|-------|-------------------------------------|
| <b>Primary Key</b> | SERVICE.SERVICE_ID          |       | <input checked="" type="checkbox"/> |
| <b>Foreign Key</b> | RESERVATION_LINE.SERVICE_ID |       | <input checked="" type="checkbox"/> |
| <b>Foreign Key</b> | INVOICE_LINE.SERVICE_ID     |       | <input checked="" type="checkbox"/> |

# WHAT DOES IT DO FOR ME?

- ▶ Index awareness is not an “always on” feature
  - ▶ In some cases it works
  - ▶ In others it does not
- ▶ When it works...
  - ▶ Keys are defined
  - ▶ User selects from the list of values
- ▶ When it does not work
  - ▶ User types the value manually
  - ▶ User responds to a prompt

# EFFICIENT SQL

- ▶ When a user selects from an index aware list of values...

```
SELECT
    max( RESORT.resort ),
    sum( INVOICE_LINE.DAYS * INVOICE_LINE.NB_GUESTS *
        SERVICE.PRICE )
FROM   RESORT,   INVOICE_LINE,   SERVICE,   SERVICE_LINE
WHERE  ( RESORT.RESORT_ID=SERVICE_LINE.RESORT_ID )
      AND ( SERVICE_LINE.SL_ID=SERVICE.SL_ID )
      AND ( SERVICE.SERVICE_ID=INVOICE_LINE.SERVICE_ID )
      AND RESORT.RESORT_ID = 2
GROUP BY
    RESORT.RESORT_ID
```

 Demonstration 1 – Index aware queries

# EVEN MORE EFFICIENT SQL

- ▶ If the index aware object is not in the output set

SELECT

sum(INVOICE\_LINE.DAYS \* INVOICE\_LINE.NB\_GUESTS \*  
SERVICE.PRICE)

FROM INVOICE\_LINE, SERVICE, SERVICE\_LINE

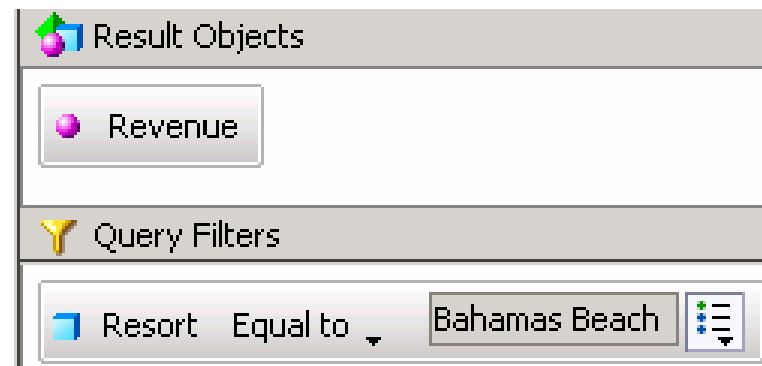

WHERE ( SERVICE\_LINE.SL\_ID=SERVICE.SL\_ID )

AND ( SERVICE.SERVICE\_ID=INVOICE\_LINE.SERVICE\_ID )

AND SERVICE\_LINE.RESORT\_ID = 2

- ▶ Query changes

- ▶ Condition moves to the foreign key
- ▶ Resort table is eliminated

 Demonstration 2 – Index aware query with no result dimension

# FACT-ONLY QUERIES ARE POSSIBLE

- ▶ The query is extremely efficient...
- ▶ ... but the report is not very useful

```
SELECT
    sum(SHOP_FACTS.Amount_sold)
FROM
    SHOP_FACTS
WHERE
    (SHOP_FACTS.WEEK_KEY    =    233
    AND
    SHOP_FACTS.ARTICLE_CODE =    177264
    AND
    SHOP_FACTS.SHOP_CODE    =    203)
```

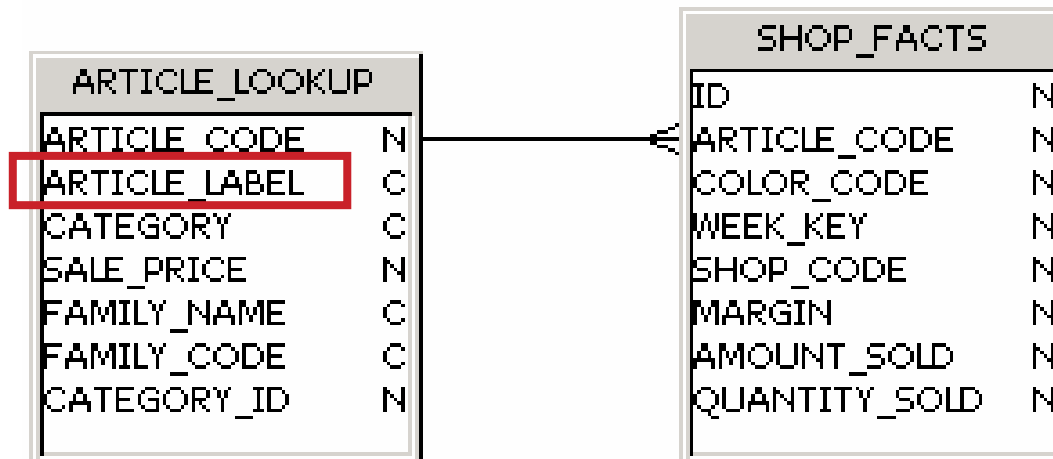

| Sales revenue |         |
|---------------|---------|
|               | \$4,309 |

# INDEX AWARE LIMITATIONS

- ▶ Keys are defined for individual objects rather than tables
  - ▶ Object LOV is altered automatically
  - ▶ That is why the LOV must be invoked
- ▶ Only unique values are candidates
  - ▶ Snow-flaking may be required to fully leverage this feature
- ▶ Let's review a simple case in Universe Designer

🖥️ Demonstration 4 – Universe Designer (covers the next several slides)

# CATEGORY KEYS DEFINED

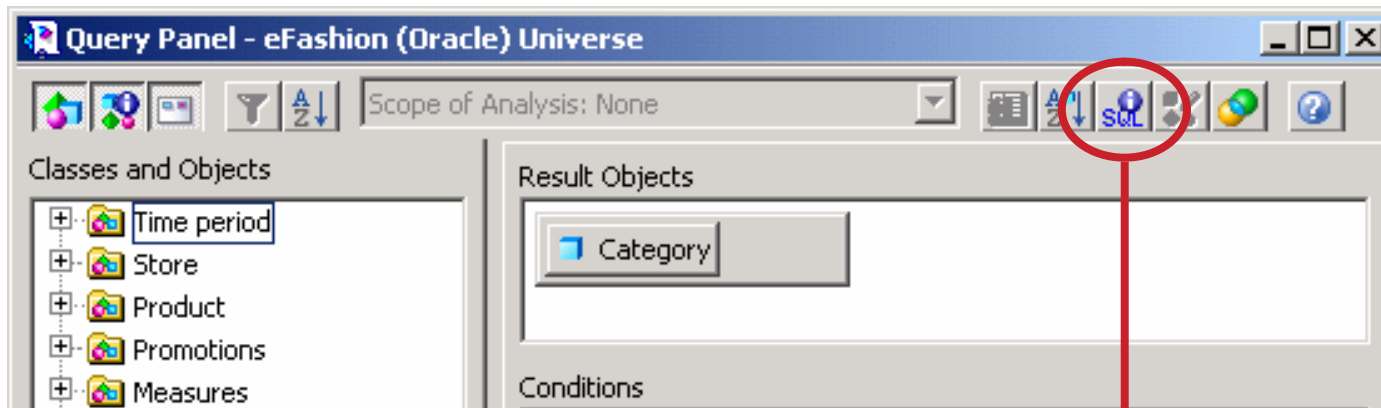

- ▶ The category object comes from the ARTICLE\_LOOKUP table
- ▶ Foreign key is in the SHOP\_FACTS table

The screenshot shows a dialog box titled "Edit Properties of Category" with a close button (X) in the top right corner. The dialog has five tabs: "Definition", "Properties", "Advanced", "Keys", and "Source Information". The "Keys" tab is currently selected. Inside the dialog, there is a text label "Define primary key and foreign key for this object." followed by a dropdown menu showing "Number". Below this is a table with four columns: "Key Type", "Select", "Where", and "Enable".

| Key Type           | Select                      | Where | Enable                              |
|--------------------|-----------------------------|-------|-------------------------------------|
| <b>Primary Key</b> | ARTICLE_LOOKUP.ARTICLE_CODE |       | <input checked="" type="checkbox"/> |
| <b>Foreign Key</b> | SHOP_FACTS.ARTICLE_CODE     |       | <input checked="" type="checkbox"/> |

# LOV UPDATES AUTOMATICALLY

- ▶ LOV contains an invisible reference to the KEY column

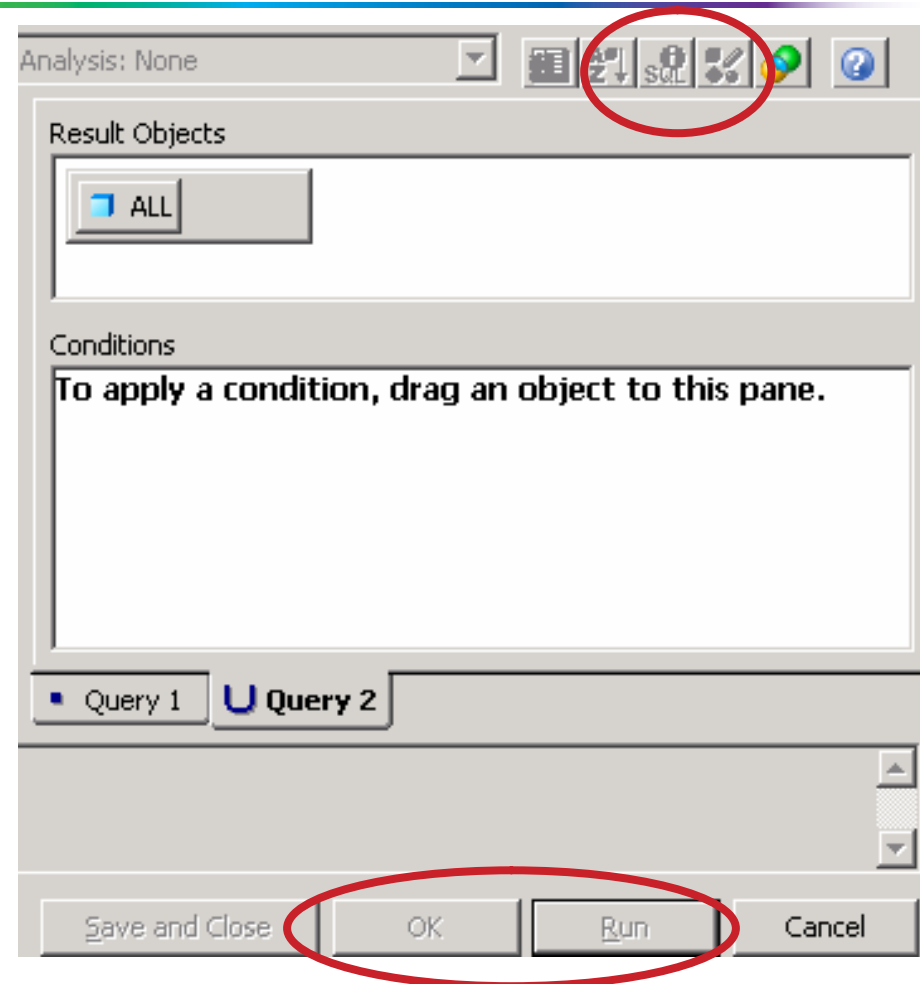

```
SELECT DISTINCT
  ARTICLE_LOOKUP.CATEGORY,
  ARTICLE_LOOKUP.ARTICLE_CODE
FROM
  ARTICLE_LOOKUP
```

- ▶ Key column is what drives index aware

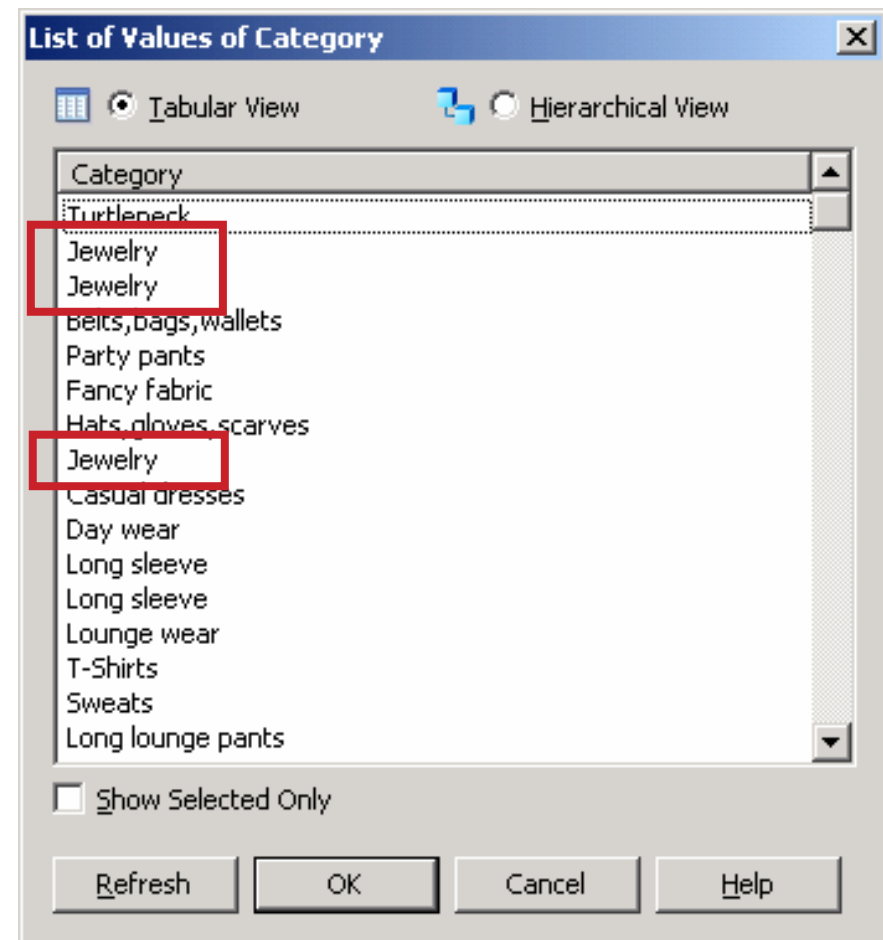

# CANNOT ADD “ALL” TO THE LOV

- ▶ Because the LOV contains two columns
  - ▶ One dimension value
  - ▶ One invisible key value
- ▶ SQL cannot be generated if “ALL” is added to the LOV

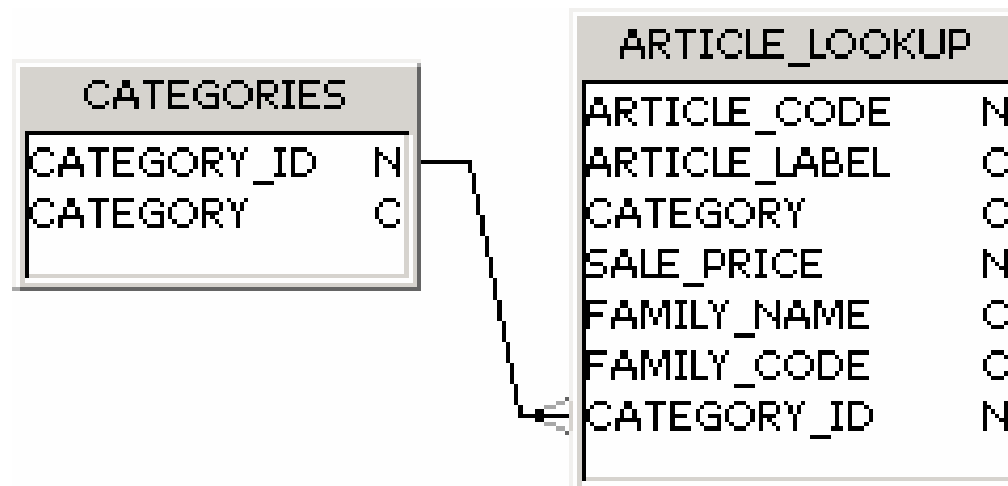

# LOV VALUES LOOK STRANGE...

- ▶ Article key is at a lower level than category
- ▶ Category values duplicate because of the addition of this column

# FIXING THE CATEGORY OBJECT

- ▶ A snowflake dimensional model works better than a star

# FIXING THE CATEGORY OBJECT

---

- ▶ More opportunities to define keys
- ▶ More opportunities for table elimination
- ▶ Process
  - ▶ Create and populate the snowflake table (not via Universe Designer)
  - ▶ Include the table, add joins, update contexts
  - ▶ Set up the keys and test the results
- ▶ Do not use a derived table as you won't have a key

# THINGS THAT DO NOT WORK

---

- ▶ Manual LOV selections are required
- ▶ Prompt LOV selections do not invoke this feature
- ▶ Index awareness and aggregate awareness do not mix
  - ▶ Aggregate aware objects can reference more than one table
  - ▶ Index awareness requires a unique primary key definition
- ▶ May require snowflake tables
  - ▶ Only unique element from a dimension table can be index aware
  - ▶ Non-unique values will have improper LOV contents

# IS IT WORTH SETTING UP?

---

- ▶ Yes, if you have a lot of ad-hoc users
- ▶ Yes, if you are working with a normalized or snowflake structure with lots of key opportunities
- ▶ Yes, if you have extra time during your implementation
- ▶ Probably not, if you have a star schema
  - ▶ Not enough options to define key values
- ▶ No, if you deliver primarily canned reports with prompts
- ▶ No, if you want to include “ALL” as an option in your LOV
- ▶ No, if you use `@Aggregate_Aware( )`
  - ▶ In my opinion aggregate tables provide more benefit

# BONUS MATERIAL

---

- ▶ The primary\_key undocumented option enables index awareness on Designer prompts
  - ▶ Prompt on key column
  - ▶ List of values from related attribute

```
RESORT.RESORT_ID IN @Prompt('Please select  
Resort','A','Resort\Resort',multi,primary_key)
```

- ▶ The primary\_key attribute is not documented...
- ▶ ... but does appear to work
- ▶ Use at your own risk

 Demonstration 6a – Prompts with index aware and primary\_key

# WHAT IS INDEX AWARENESS?

---

- ▶ What does the Universe Designer help say?

*Object keys allow Universe Designer to generate more efficient SQL by filtering on primary key values and eliminating unnecessary joins.*

- ▶ ... but only when the user manually selects a value from a list of values on the query panel
- ▶ No prompts
- ▶ No aggregate tables
- ▶ No “ALL” option
- ▶ Limited to key (unique) dimensions

# LEVERAGING SHORTCUT JOINS

*If ignorant both of your enemy and yourself, you are certain to be in peril.*

– Sun Tzu

# WHAT ARE SHORTCUT JOINS?

---

- ▶ What does the Universe Designer help say?

*A shortcut join is a join that provides an alternative path between two tables. Shortcut joins improve the performance of a query by not taking into account intermediate tables, and so shortening a normally longer join path.*

- ▶ This is the **only** purpose of a shortcut
- ▶ Do not use shortcuts to resolve loops
  - ▶ Use the appropriate method (alias or context) instead
  - ▶ Loops will not be discussed today

# HOW MANY SHORTCUTS CAN I TAKE?

- ▶ Multiple shortcut joins can be used at the same time
- ▶ ... but only in the right situation
- ▶ For example consider these four tables

- ▶ Shortcuts are applied only if they remove a table
- ▶ Shortcuts do not provide an alternate route, only a shorter path

# HUH?

- ▶ Repeated from prior slide: Shortcuts do not provide an alternate route, only a shorter path
- ▶ Consider a query with objects from table A, C, and D

- ▶ The only valid path is A – C – D, using shortcut A – C
- ▶ Why not A – D – C instead?

# TABLE REMOVAL ALGORITHM

---

- ▶ Query includes objects from table A, C, and D
- ▶ Shortcut A – C is considered as it drops table B, which is not needed
- ▶ Shortcut A – D is considered but cannot be used as it drops table C which is needed
- ▶ Therefore the only valid query path is A – C – D
- ▶ This avoids a “backwards” join which could result in a Cartesian product

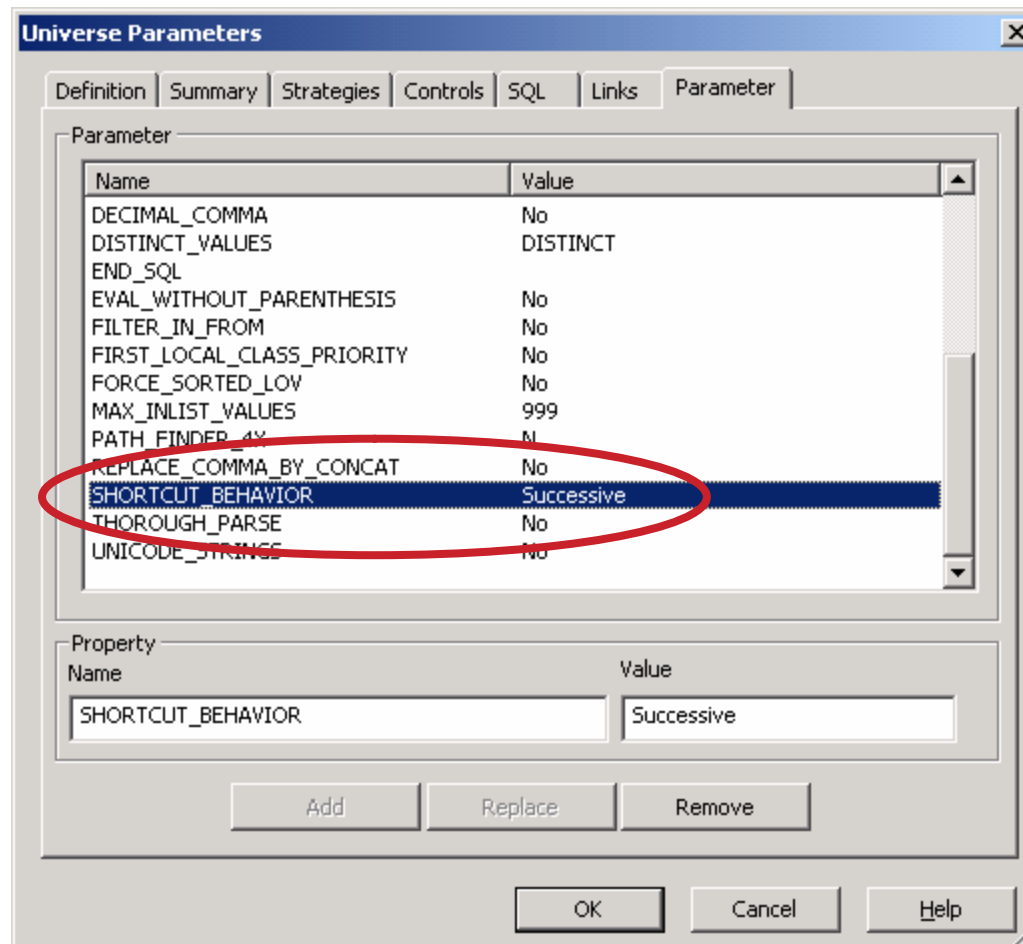

# SHORTCUT\_BEHAVIOR

---

- ▶ There is a parameter in the .PRM file (6.0) or the universe parameters (6.5 and higher) that configures the shortcut process
- ▶ 6.0 PRM file entry is GLOBAL\_SHORTCUTS
  - ▶ N or Missing = standard shortcut behavior
  - ▶ Y = try to use every shortcut that is available
- ▶ 6.5 + universe parameter SHORTCUT\_BEHAVIOR
  - ▶ Successive = standard shortcut behavior
  - ▶ Global = try to use every shortcut available
  - ▶ Note: Universe Designer help (XI R2) says global is the default which does not appear to be the case
- ▶ When should you change this?

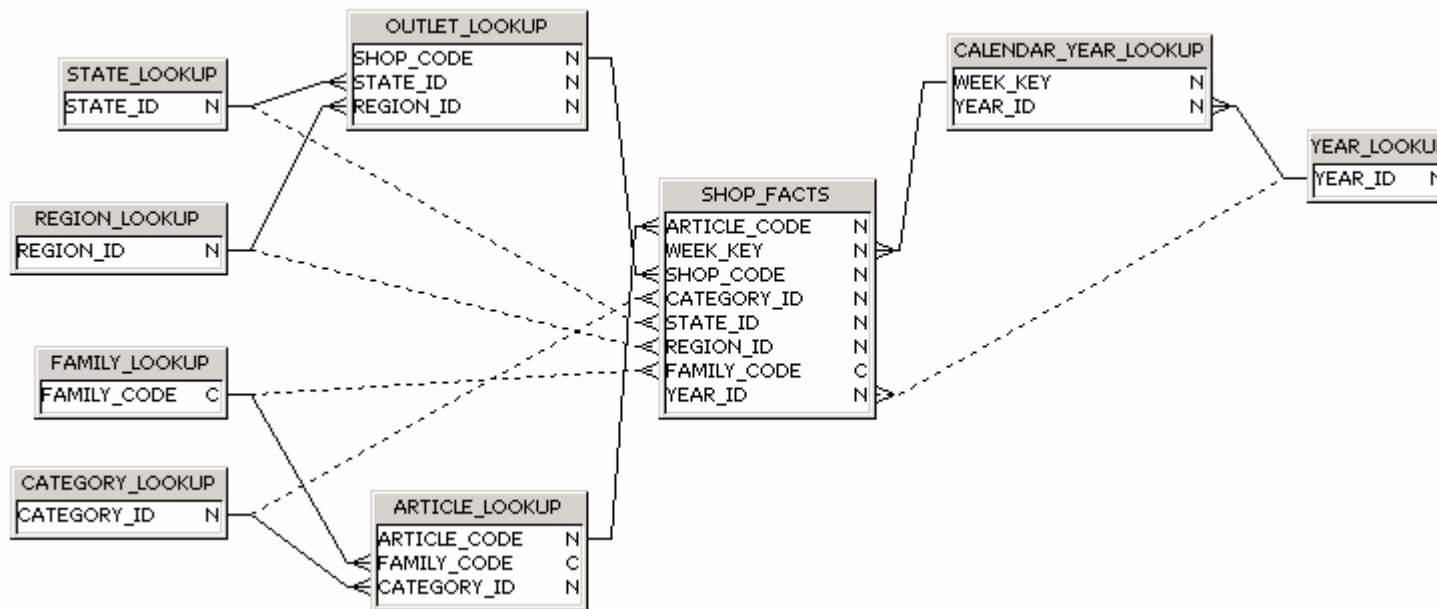

# UNIVERSE PARAMETER SETTING

- ▶ You may have to add the setting if it does not already exist...

# SHORTCUT\_BEHAVIOR BEHAVIOR

- ▶ Consider a modified version of eFashion

- ▶ Category, family (product line), region, state, and year dimensions have been snowflaked
- ▶ Shortcut joins exist between all snowflake tables and the fact table

# SHORTCUT\_BEHAVIOR SUCCESSIVE

---

```
SELECT
    max( REGION_LOOKUP.REGION_NAME ),
    max( STATE_LOOKUP.STATE ),
    sum(SHOP_FACTS.Amount_sold)
FROM
    REGION_LOOKUP,
    STATE_LOOKUP,
    SHOP_FACTS,
    OUTLET_LOOKUP
WHERE
    ( OUTLET_LOOKUP.SHOP_CODE=SHOP_FACTS.SHOP_CODE )
    AND ( STATE_LOOKUP.STATE_ID=OUTLET_LOOKUP.STATE_ID )
    AND ( REGION_LOOKUP.REGION_ID=OUTLET_LOOKUP.REGION_ID
)
GROUP BY
    REGION_LOOKUP.REGION_ID,
    STATE_LOOKUP.STATE_ID
```

 Demonstration 7 – Shortcut joins in a snowflake schema

# SHORTCUT\_BEHAVIOR GLOBAL

- ▶ Removing the OUTLET\_LOOKUP table makes a more efficient query in the snowflake universe

```
SELECT
    max( REGION_LOOKUP.REGION_NAME ),
    max( STATE_LOOKUP.STATE ),
    sum(SHOP_FACTS.Amount_sold)
FROM
    STATE_LOOKUP,
    SHOP_FACTS,
    REGION_LOOKUP
WHERE
    ( STATE_LOOKUP.STATE_ID=SHOP_FACTS.STATE_ID )
    AND ( REGION_LOOKUP.REGION_ID=SHOP_FACTS.REGION_ID )
GROUP BY
    REGION_LOOKUP.REGION_ID,
    STATE_LOOKUP.STATE_ID
```

 Demonstration 7 (Repeat) – Shortcut joins in a snowflake schema

# SHORTCUT\_BEHAVIOR GLOBAL

- ▶ A global setting changes the shortcut algorithm

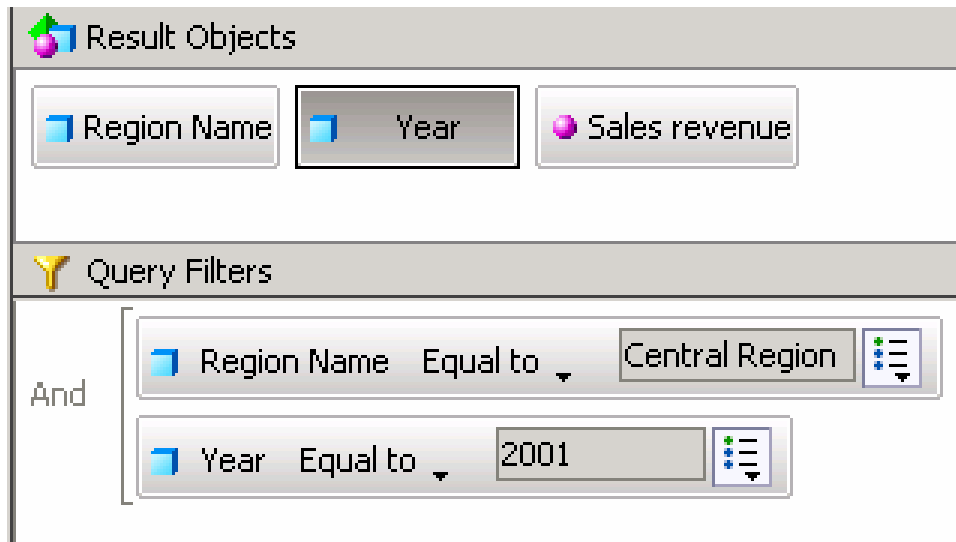

# SHORTCUT\_BEHAVIOR GLOBAL

---

- ▶ Two potential shortcuts
  - ▶ STATE\_LOOKUP to SHOP\_FACTS
  - ▶ REGION\_LOOKUP to SHOP\_FACTS
- ▶ Either would drop the OUTLET\_LOOKUP table
- ▶ Successive processes joins one at a time
  - ▶ OUTLET\_LOOKUP won't be dropped because the "other" join requires that table
- ▶ Global processes all at once and recognizes that it can drop the table

# SHORTCUT JOINS + INDEX AWARENESS

- ▶ The SQL on the prior page showed this  
`max( REGION_LOOKUP.REGION_NAME )`
- ▶ This is because index keys have been set up in the snowflake universe
- ▶ How does index aware interact with shortcut joins?

 Demonstration 8 – Shortcut joins and index aware objects

# SQL SHORTCUTS ALL THE WAY AROUND

- ▶ Shortcut joins are used
- ▶ Index keys are used

```
SELECT
    max( REGION_LOOKUP.REGION_NAME ),
    max( YEAR_LOOKUP.YEAR ),
    sum(SHOP_FACTS.Amount_sold)
FROM  REGION_LOOKUP,  SHOP_FACTS,  YEAR_LOOKUP
WHERE
    ( REGION_LOOKUP.REGION_ID=SHOP_FACTS.REGION_ID )
    AND  ( SHOP_FACTS.YEAR_ID=YEAR_LOOKUP.YEAR_ID )
    AND  ( REGION_LOOKUP.REGION_ID  =  2
          AND YEAR_LOOKUP.YEAR_ID  =  3 )
GROUP BY
    REGION_LOOKUP.REGION_ID,
    YEAR_LOOKUP.YEAR_ID
```

# SHORTCUTS, INDEXES, AND GLOBAL PARAMETERS, OH MY!

- ▶ The last example did not require global shortcut behavior
- ▶ What happens when index aware objects are used in combination with global shortcut paths?
- ▶ This query uses region name and state
  - ▶ Both reference the OUTLET\_LOOKUP table for index keys
  - ▶ Both have shortcuts to the SHOP\_FACTS table

 Demonstration 9 – Shortcut joins, index aware objects, and global algorithm

# SQL SHORTCUTS ALL THE WAY AROUND

- ▶ Shortcut joins are used
- ▶ Index keys are used

```
SELECT
    max( REGION_LOOKUP.REGION_NAME  ),
    max( STATE_LOOKUP.STATE  ),
    sum(SHOP_FACTS.Amount_sold)
FROM  STATE_LOOKUP,  SHOP_FACTS,  REGION_LOOKUP
WHERE
    ( STATE_LOOKUP.STATE_ID=SHOP_FACTS.STATE_ID  )
    AND
    (REGION_LOOKUP.REGION_ID=SHOP_FACTS.REGION_ID  )
    AND  ( REGION_LOOKUP.REGION_ID  =  2
        AND  STATE_LOOKUP.STATE_ID  =  1  )
GROUP BY  REGION_LOOKUP.REGION_ID,
          STATE_LOOKUP.STATE_ID
```

# WHAT ARE SHORTCUT JOINS?

---

- ▶ What does the Universe Designer help say?

*A shortcut join is a join that provides an alternative path between two tables. Shortcut joins improve the performance of a query by not taking into account intermediate tables, and so shortening a normally longer join path.*

- ▶ Shortcuts are used to eliminate tables not provide alternate paths
- ▶ There are two different behaviors for the shortcut algorithm, use the one that fits your needs

# USING JOIN\_BY\_SQL

*For to win one hundred victories in one hundred battles is not the acme of skill. To subdue the enemy without fighting is the acme of skill.*

– Sun Tzu

# WHAT IS JOIN\_BY\_SQL?

---

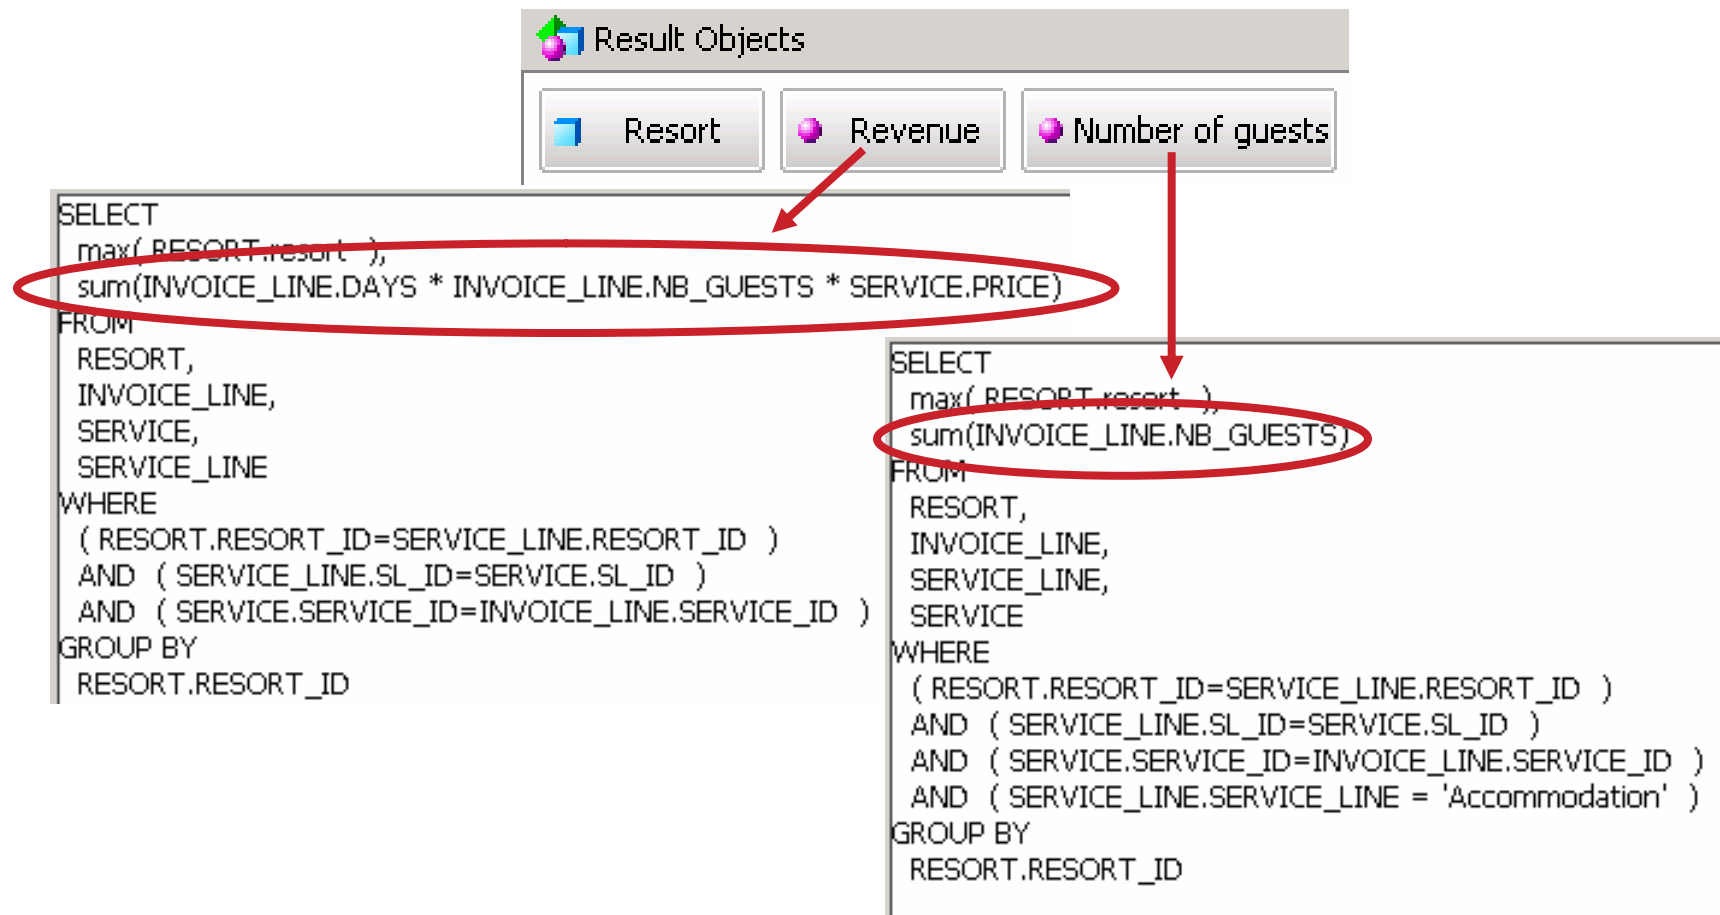

- ▶ What does the Universe Designer help say?

- ▶ Despite the lack of information this is a very interesting feature
- ▶ It can reduce or eliminate the need for multiple data providers
- ▶ This feature is not supported by Desktop Intelligence
- ▶ This feature did not work reliably until SP2

# BEFORE JOIN\_BY\_SQL

- ▶ The following query would normally generate two select statements

# IMPACT OF MULTIPLE QUERIES

---

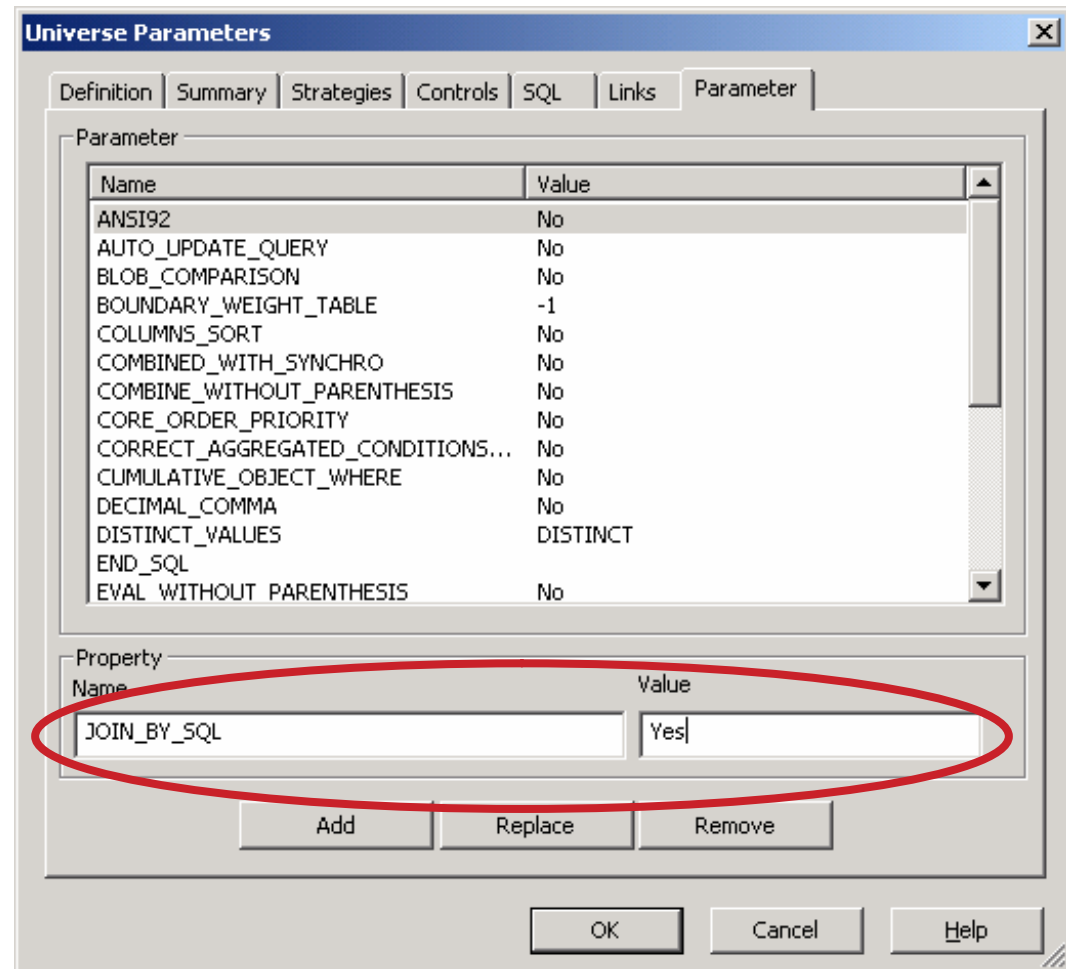

- ▶ One connection for each query
- ▶ One download (fetch) phase for each query
- ▶ Resulting data sets are joined (merged) by the client
- ▶ Higher load on the Web Intelligence server
- ▶ Consider the following
  - ▶ Four data providers: CY YTD, PY YTD, CY MTD, and PY MTD
  - ▶ Each returns 5,000 rows
  - ▶ **Four** fetch phases
  - ▶ **20,000 rows of data on the client**
  - ▶ Client merges the data
- ▶ Where is the power?

 Demonstration 10 – Synchronized queries across contexts

# ADDING THE PARAMETER

- ▶ File + Parameters
- ▶ Parameter tab
- ▶ See if it's there...
- ▶ ... if not, add it in
  - ▶ Name = JOIN\_BY\_SQL
  - ▶ Value = Yes

# AFTER JOIN\_BY\_SQL

- ▶ The same query generates one combined query

```
SELECT
    NVL( F__1.Axis__1,F__2.Axis__1),
    F__1.M__7,
    F__2.M__20
FROM
    ( SELECT ... ) F__1
FULL OUTER JOIN
    ( SELECT ... ) F__2
ON (F__1.KEY__79 = F__2.KEY__79)
```

- ▶ KEY\_\_79 is the Resort ID

```
SELECT
    NVL( F__1.Axis__1,F__2.Axis__1 ),
    F__1.M__7,
    F__2.M__20
FROM
    (
        SELECT
            max( RESORT.resort ) AS Axis__1,
            sum(INVOICE_LINE.DAYS * INVOICE_LINE.NB_GUESTS * SERVICE.PRICE) AS M__7,
            RESORT.RESORT_ID AS Key__79
        FROM
            RESORT,
            INVOICE_LINE,
            SERVICE,
            SERVICE_LINE
        WHERE
            ( RESORT.RESORT_ID=SERVICE_LINE.RESORT_ID )
            AND ( SERVICE_LINE.SL_ID=SERVICE.SL_ID )
            AND ( SERVICE.SERVICE_ID=INVOICE_LINE.SERVICE_ID )
        GROUP BY
            RESORT.RESORT_ID
    )
    F__1
FULL OUTER JOIN
    (
        SELECT
            max( RESORT.resort ) AS Axis__1,
            sum(INVOICE_LINE.NB_GUESTS) AS M__20,
            RESORT.RESORT_ID AS Key__79
        FROM
            RESORT,
            INVOICE_LINE,
            SERVICE_LINE,
            SERVICE
        WHERE
            ( RESORT.RESORT_ID=SERVICE_LINE.RESORT_ID )
            AND ( SERVICE_LINE.SL_ID=SERVICE.SL_ID )
            AND ( SERVICE.SERVICE_ID=INVOICE_LINE.SERVICE_ID )
            AND ( SERVICE_LINE.SERVICE_LINE = 'Accommodation' )
        GROUP BY
            RESORT.RESORT_ID
    )
    F__2
ON ( F__1.Key__79=F__2.Key__79 )
```

# IMPACT OF SINGLE QUERY

---

- ▶ One connection
- ▶ One download (fetch) phase
- ▶ Resulting data sets are joined (merged) by the server
- ▶ Lower load on the Web Intelligence server
- ▶ Reconsider the following
  - ▶ Four data providers: CY YTD, PY YTD, CY MTD, and PY MTD
  - ▶ Each returns 5,000 rows
  - ▶ Database merges the result rows via a Full Outer Join pass
  - ▶ **One** fetch phase
  - ▶ **5,000 rows of data on the client**
  - ▶ Client data merge step is gone

 Demonstration 10 (Repeat) – JOIN\_BY\_SQL combined SQL across contexts

# PUTTING IT ALL TOGETHER

- ▶ Will index awareness, shortcut joins, and JOIN\_BY\_SQL all play nicely together?
  - ▶ Select a region from a list of values
  - ▶ Select two measures that will require separate query passes
  - ▶ Include values from the snowflake tables
  - ▶ What will the query look like?

The screenshot shows a query builder interface with two main sections: 'Result Objects' and 'Query Filters'.

**Result Objects:** This section contains three buttons: 'Year' (with a blue cube icon), 'Sales revenue' (with a purple sphere icon), and 'Discount' (with a purple sphere icon).

**Query Filters:** This section contains a single filter: 'Region Name' (with a blue cube icon) followed by 'Equal to' and a dropdown menu showing 'Central Region' (with a blue cube icon).

# TRIPLE PLAY COMBINATION

► Full outer join? Yes

► Shortcut join? Yes

```
FROM YEAR_LOOKUP,
      SHOP_FACTS
WHERE (
  SHOP_FACTS.YEAR_ID =
  YEAR_LOOKUP.YEAR_ID )
```

► Index aware? Yes

```
SHOP_FACTS.REGION_ID = 2
```

| Year | Sales revenue | Discount  |
|------|---------------|-----------|
| 1999 | \$2,937,592   | \$572,165 |
| 2000 | \$4,883,547   | \$237,177 |
| 2001 | \$5,319,184   | \$718,027 |

```
SELECT
  NVL( F__1.Axis__1,F__2.Axis__1 ),
  F__1.M__147,
  F__2.M__191
FROM
  (
    SELECT
      max( YEAR_LOOKUP.YEAR ) AS Axis__1,
      sum(SHOP_FACTS.Amount_sold) AS M__147,
      YEAR_LOOKUP.YEAR_ID AS Key__562
    FROM
      YEAR_LOOKUP,
      SHOP_FACTS
    WHERE
      ( SHOP_FACTS.YEAR_ID=YEAR_LOOKUP.YEAR_ID )
      AND
      SHOP_FACTS.REGION_ID = 2
```

🖥️ Demonstration 11 – Triple play (index aware, shortcuts, and JOIN\_BY\_SQL)

# CASE STUDY

---

- ▶ Current project details
  - ▶ Teradata 6.2
  - ▶ Billions of rows in the fact table
  - ▶ Not using @Aggregate\_Aware()
    - ▶ All aggregation is done by the database
- ▶ Index aware has not been implemented due to the number of canned reports with prompts
- ▶ Shortcut joins behavior is set to global to leverage snowflake design
- ▶ Implementing JOIN\_BY\_SQL resulted in a 50% reduction in query time and a 75-85% reduction in report size

# CONCLUSION

- ▶ Entering index keys on appropriate objects can generate very efficient SQL
  - ▶ But many things can get in the way of its use
- ▶ Shortcut joins can be very helpful for tuning
  - ▶ Be sure to know how they are going to interact with the rest of your universe
- ▶ JOIN\_BY\_SQL pushes the data synchronization process back to the database engine
  - ▶ It works best with measures
- ▶ All of these options can make your universe better but will not fix structural issues
- ▶ Make sure your universe works before adding these tweaks

# WHAT IS COMING IN PART TWO?

---

- ▶ Some interesting tricks with derived tables and some fancy report variables
  - ▶ Making up fake data
  - ▶ Getting creative with the DrillFilters() function
- ▶ Lots of good stuff about List of Values (LOV) customizations
  - ▶ Using “ALL” to simulate optional prompts (standard approach)
  - ▶ Using “ALL” with a derived table approach (new technique)
  - ▶ Working with cascading LOV queries
  - ▶ Adding an “ALL” option to cascading LOV queries

# Q&A

- ▶ Thank you for your time and attention today
- ▶ Questions
  - ▶ David G. Rathbun, Integra Solutions
